

Natural Resource Security: Geostrategic Context

ISOA Europe Industry Days, April 2025

Global Energy Demand

Fossil fuels continue to hover around 80% of all primary energy consumption worldwide

Global primary energy consumption by source

Primary energy¹ is based on the substitution method² and measured in terawatt-hours³.

Data source: Energy Institute - Statistical Review of World Energy (2024); Smil (2017)

OurWorldinData.org/energy | CC BY

Note: In the absence of more recent data, traditional biomass is assumed constant since 2015.

Forecast for Significant Demand Growth (?)

Global Oil Production

Reserves-to-production (R/P) ratios

Years

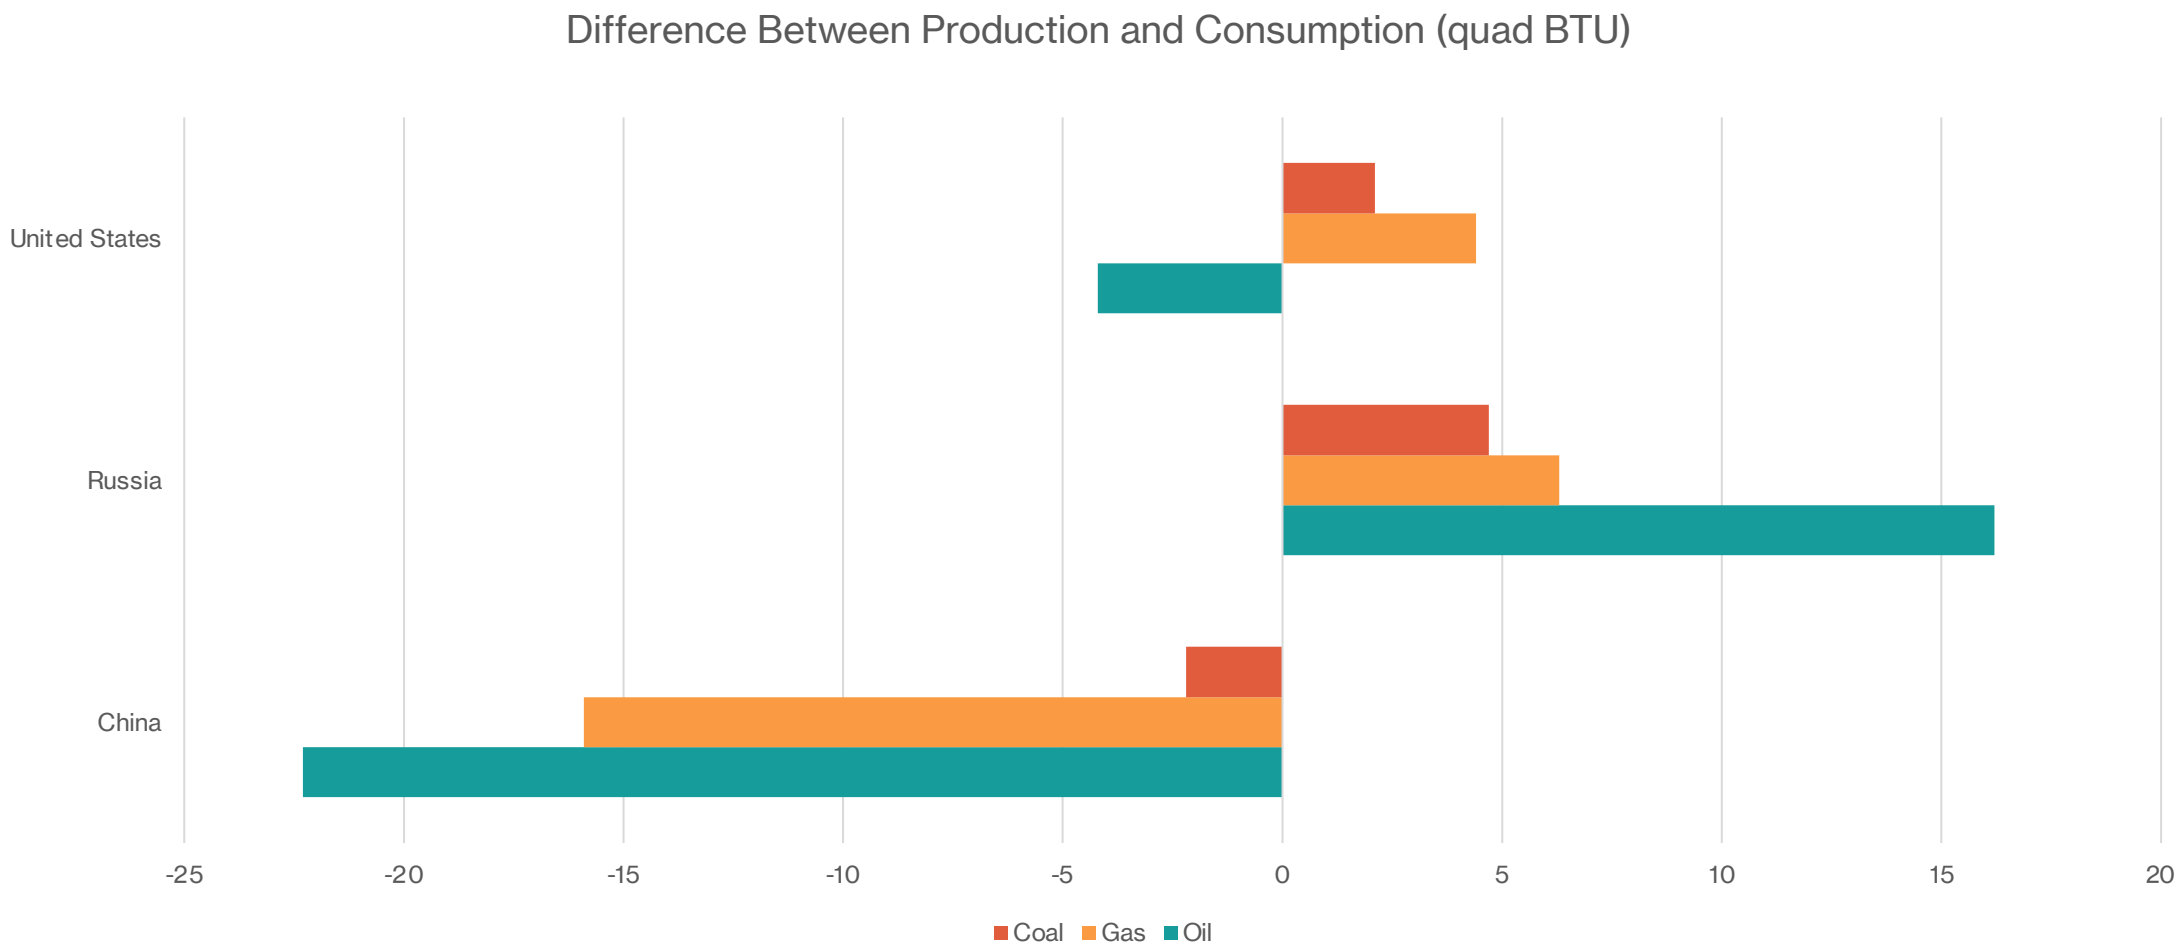

2020 by region

The top 10 oil¹ producers and share of total world oil production² in 2022³

Country	Million barrels per day	Share of world total
United States	20.30	21%
Saudi Arabia	12.44	13%
Russia	10.13	10%
Canada	5.83	6%
Iraq	4.61	5%
China	4.45	5%
United Arab Emirates	4.23	4%
Iran	3.67	4%
Brazil	3.17	3%
Kuwait	3.01	3%
Total top 10	71.83	74%
World total	97.70	

Fossil Fuels and Strategic Competition

The Flip Side of Fossil Fuel Dominance

Global fossil CO₂ emissions: 37.1 ± 2 GtCO₂ in 2022, 63% over 1990

● Projection for 2023: 37.5 ± 2 GtCO₂, 1.1% [0.0% to +2.1%] higher than 2022

Uncertainty is $\pm 5\%$ for one standard deviation (IPCC “likely” range)

When including cement carbonation, the 2022 and 2023 estimates amount to 36.4 ± 2 GtCO₂ and 36.8 ± 2 GtCO₂ respectively

The 2023 projection is based on preliminary data and modelling.

2024 Arctic sea ice summer minimum

September 11, 2024

Sea ice concentration (percent)

NOAA Climate.gov

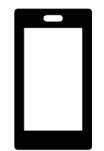

Data: NSIDC

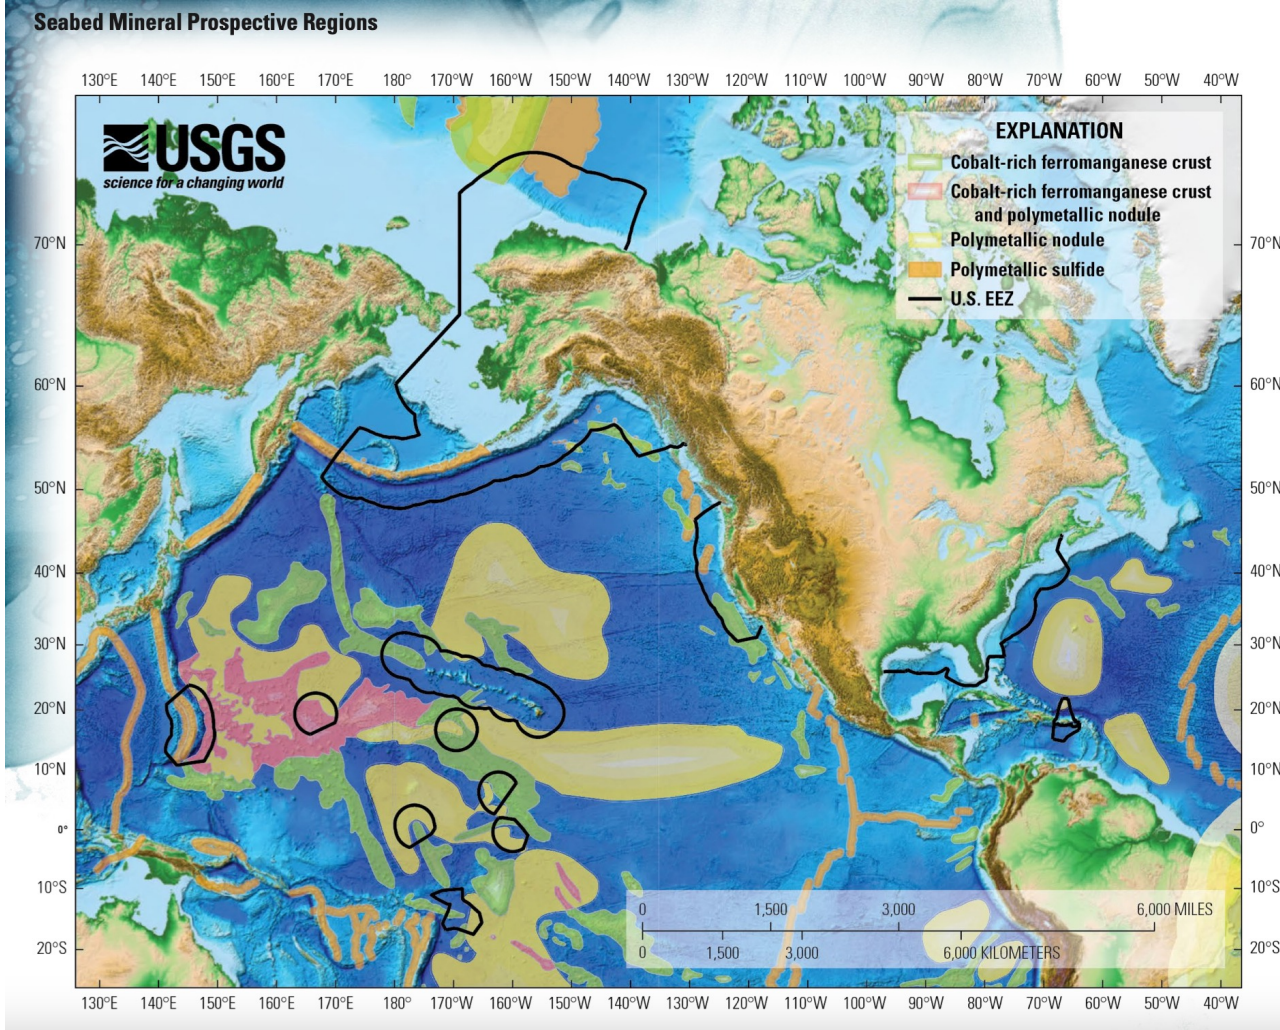

- New global trade routes
- New access to considerable resources
- All NATO nations on the littoral – except for Russia
- Icebreaker gap (48?)

“Changes in Arctic [sea ice cover](#) have wide-ranging impacts. The sea ice affects local ecosystems, regional and global weather patterns, and the circulation of the oceans”

Minerals Demand Growth

Major Critical Minerals End Uses				
Defense	Electronics	Medical	Energy	Infrastructure
				
Platforms Munitions Equipment Space Robotics	Smartphones Computers TVs Semi conductors	MRIs Prosthetics Pacemakers X-Rays Hearing aids	Batteries Solar Geothermal Wind Oil refining	Roads Bridges Buildings Power grids Vehicles

Snapshot: Rare Earth Elements

Top three producers 2030

<https://www.iea.org/reports/rare-earth-elements#dashboard>

Rare earths production as a share of the global total, 2023

Based on mined, rather than refined¹, production.

Data source: USGS - Mineral Commodity Summaries (2024); USGS - Historical Statistics for Mineral and Material Commodities (2023)
Note: Values are reported in tonnes of rare-earth-oxide equivalent.
CC BY

Rare earths reserves as a share of the global total, 2023

Mineral reserves¹ are resources that have been evaluated and can be mined economically with current technologies.

Data source: USGS - Mineral Commodity Summaries (2024)
Note: Values are reported in tonnes of rare-earth-oxide equivalent. Reserves can increase over time as new mineral deposits are discovered and others become economically feasible to extract.
CC BY

Snapshot: Antimony

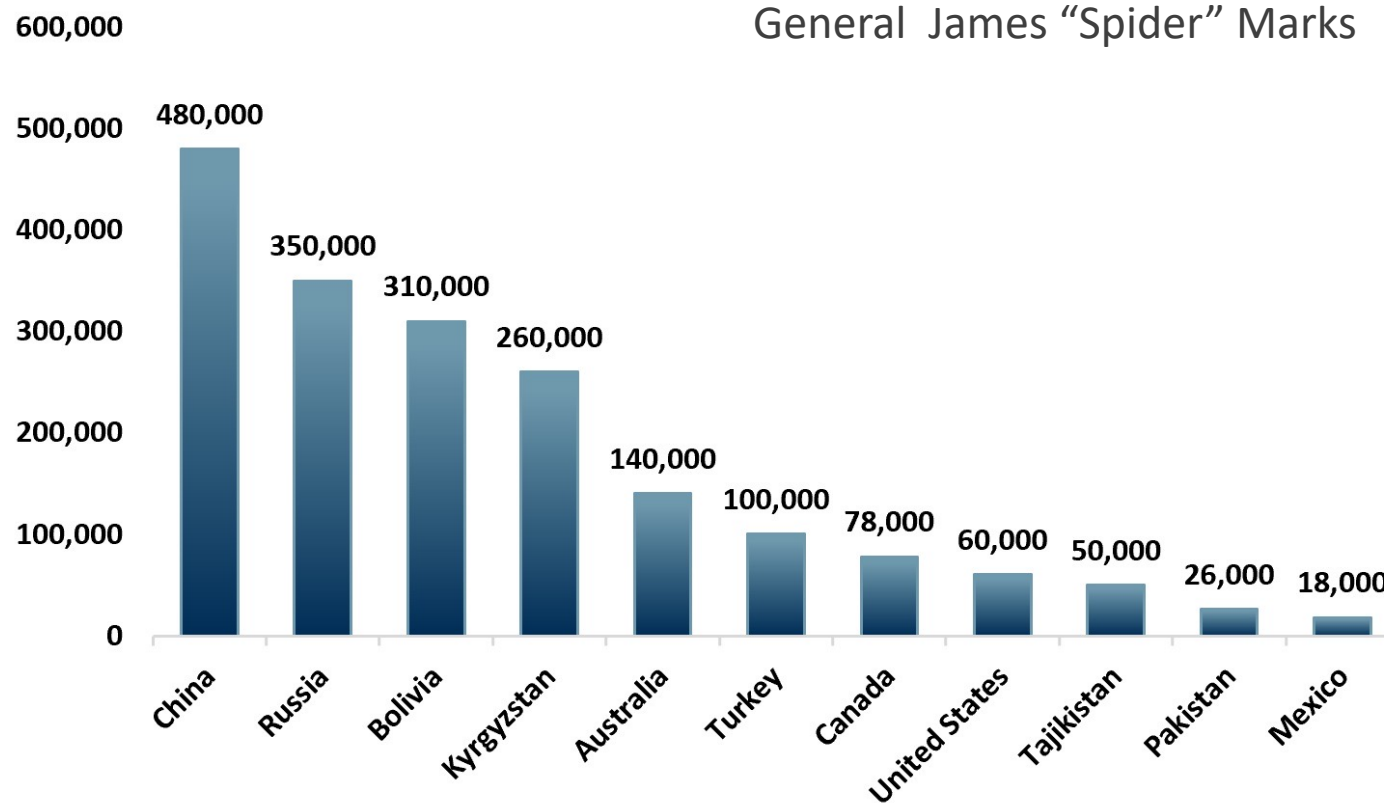

- Automotive batteries (lead-acid)
- Ceramics and glass
- Flame retardants (flameproof fabrics)
- Automotive brake pads (additive to adjust co-efficient of friction)
- Cable sheathing

Uses according to US Department of Defense website

“Antimony is a key ingredient in communication equipment, night vision goggles, explosives, ammunition, nuclear weapons, submarines, warships, optics, laser sighting, and much more.” Major General James “Spider” Marks
